

focus on: sensors and motion detectors

1 **StanVision™ from Stanley® Access Technologies**

StanVision is a door sensing system that uses digital camera technology to perform the functions of a door sensor and security camera. It is designed to fit any automatic door and can be integrated with existing CCTV systems or local monitors.

To provide surveillance and operate the door, a camera is placed above the inside and outside, transmitting activity on each door cycle. The security perimeter at each door is extended by 10' and the need for additional security cameras at entrances may be reduced.

Unlike traditional microwave and infrared door sensing technologies

that detect movement or an object's presence, StanVision uses digital video camera technology to evaluate pixel changes in video images to detect motion.

Stanley's StanVision system is also available with OnGuard technology to enhance its security capabilities. OnGuard features two additional cameras, an integrated alarm system, impact resistant security glass, and crash bars.
